AI Usage Report

Project Name: SaleSphere – Self-Healing CRM

1. AI Tool Used

ChatGPT was used as an AI assistance tool during the development of SaleSphere.

2. Purpose of AI Usage

AI was used to help understand technical concepts, troubleshoot coding errors, improve the user interface, and develop self-healing features such as failure detection, diagnosis, and automatic recovery.

AI Usage Details

Area	How AI Was Used
Code Development	Helped with code suggestions and implementing project features.
Debugging	Assisted in identifying errors and suggesting fixes.
UI Design	Suggested improvements to the layout, styling, and user experience.
Self-Healing Features	Helped implement failure detection, diagnosis, and automatic recovery logic.
Testing	Provided guidance for testing failures and verifying recovery behavior.
Documentation	Helped prepare project explanations and technical summaries.

3. Extent of AI Usage

AI assistance was used at multiple stages of development, including planning, code suggestions, debugging, and testing guidance. The project was developed iteratively, with AI-generated suggestions reviewed and adjusted according to the project's requirements.

4. Developer's Contribution

I made the project decisions, integrated and modified the code, tested the application's functionality, and worked on resolving errors. AI was used as a supporting tool, while implementation and verification were carried out as part of the development process.

5. Conclusion

AI helped improve development efficiency and understanding of technical problems. SaleSphere was developed as a practical learning project demonstrating self-healing software concepts.
